Development of autoimmune disease, a comprehensive approach to stabilization and arresting future progression

Tom O'Bryan

Institute of Functional Medicine, USA

Autoimmune diseases are listed as the third leading cause of morbidity and mortality in the industrialized world. That means it's in our offices every day. The number of people diagnosed with an autoimmune disease is increasing exponentially in the world today. Estimates are that anywhere from three to seven out of every 10 new patients coming into your office are suffering with an autoimmune mechanism (whether it has progressed into an autoimmune pathology or not). The volume of information now of the underlying mechanisms that set the stage and contribute to the development of autoimmune disease is overwhelming. Without recognizing and addressing the underlying mechanisms triggering the presenting complaints, the Practitioner may be proverbially 'chasing the tail' of the pathology with temporary symptom relief.
