Perspectives of maternity after breast cancer

Amirhossein Eskandari¹ and Sadaf Alipour²

¹Ministry of Health and Medical Education – Tehran - Iran

²Arash Women's Hospital - Tehran University of Medical Sciences, Iran

The age of pregnancy is rising worldwide while breast cancer is seen more frequently in young ages. These have resulted in an increasing number of breast cancer patients who have not still completed their childbearing plans. The question of pregnancy has always been alarming for the patients and their doctors because of hormonal increases during the process, and breast cancer survivors are still being advised against pregnancy by their treating physician. Studies have investigated the subject from years ago; almost no one has shown any negative impact of pregnancy on the disease prognosis, and even survival benefits have been shown. A concise review of the subject, the limitations of existing studies, as well as related issues such as the safe time interval from cancer diagnosis to pregnancy, obstetric complications, safety of lactation, pregnancy following breast reconstruction and affective consequences of the condition are discussed.

Biography

Amirhossein Eskandari Assistant Professor in Anesthesiology, Ministry of Health and Medical Education, Tehran, Iran and have a membership with that of Islamic Republic of Iran Medical Council, Iranian Association of Anesthesiology and Critical Care
