

Does the coronavirus spread through food

Ryan Zia Arslaan

Method and Material

In this paper, we complete Covid 19 contract tracing course online to enhance our knowledge interview a few food vendors. We try to derive a relation between food and the spread of the virus. The information provided by John-Hopkins University and the guidelines by WHO are referred to for conducting this study.

Result

The COVID spread is mainly by person to person and we found out that many areas of

necessary research remain unexplored, such as the lifetime of viruses on the food surface.

It is suggested that the consumers sanitise food packings to get surface level protection,

not the food. Boycotting food vendors is not a solution.

Conclusion

In the early COVID-19 phase researchers generated many publications. Although, there

are still knowledge voids and guidelines related to COVID-19, it's still not very clear if it's

spread by food. Our analysis of COVID spread may be valuable for street food consumers

all around the globe and we conclude that more steps need to be taken to educate people

about COVID spread and food.

Biography

Mr Ryan Zia Arslaan, had full access to all of the data in the study and take responsibility for the integrity of the data and the accuracy of the data analysis. Study concept and design: Mr Sumeet Sharma acquisition, analysis, and interpretation. Drafting of the manuscript: Mr Ryan Zia Arslaan. Critical revision of the manuscript for important intellectual content: Mr Sumeet Sharma.
