

Life support-based comprehensive treatment regimen” in fulminant myocarditis treatments

Chen Chen

ABSTRACT

Fulminant myocarditis is caused majorly by the infection of various viruses. It arises quickly, progresses rapidly, and may lead to severe heart failure or circulatory failure presenting as hypotension and cardiogenic shock in a short time, and its mortality is up to 50-70%. The most importantly, there are no treatment options, and no treatment guidelines or expert consensus statement.

Here, we provide first expert consensus, Chinese Society of Cardiology Expert Consensus Statement on the Diagnosis and Treatment of Fulminant Myocarditis, based on the data of our recent registered clinical trial. In this statement, we described its clinical features and diagnostic criteria, and importantly, first time we described a new treatment regimen, “life support-based comprehensive treatment regimen”. This treatment regimen includes serious managements of nutrients and fluids, sufficient doses of glucocorticoid, immunoglobulin, antiviral reagents, continuous renal replacement therapy and life-support treatments including applications of mechanical respirators and circulatory support systems, intraaortic balloon pulsation (IABP) and extracorporeal membrane oxygenation (ECMO) as well as cardiac pacemaker if it is needed. Our practice in multiple cardiac centers demonstrates this treatment can dramatically lower the mortality of the patients with fulminant myocarditis.

BIOGRAPHY

Chen Chen has completed her PhD at the age of 27 years from Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, China. She is now the professor of Tongji Hospital. She has over 30 publications that have been cited over 500 times, and her publication H-index is 15 and has been serving as an editorial board member of reputed Journals.
