

## **Market Analysis:**

### **Mental Health Research & funding opportunities globally:**

Mental diseases or psychotherapeutic conditions are classified for a fixed period as abnormal thoughts, feelings and behaviors, causing distress or physical or emotional impairment. These include a wide variety and often require medical or clinical treatment. Conditions may be caused by a genetic, chemical or anatomical biological origin, or by a psychological origin such as trauma or conflict.

Mental disorders represent 14% of disease around the world; yet they get a normal of just 50% of one percent (0.5%) of wellbeing spending in low-salary nations (WHO ATLAS 2011). 73% of the cash spent on emotional wellness by national governments is spent on psychiatric clinics, instead of on community care.

The United States was the biggest maker of psychological well-being research, with 36 percent of all papers having no less than one US-based author. The United States was likewise home to 31 percent of the research funders distinguished, with the most unmistakable being associations and offices inside the national government. The National

Institutes of Health (NIH) and the National Institute of Mental Health (NIMH) were the main two funders by and large, yet other research funders, for example, the National Institute on Drug Abuse (NIDA), the National Institute on Aging, and the Department of Veterans Affairs, likewise included in the main ten worldwide funders.
